Chapter 1

Classes

1.1 `finitefield` – Finite Field

- Classes
 - †**FiniteField**
 - †**FiniteFieldElement**
 - **FinitePrimeField**
 - **FinitePrimeFieldElement**
 - **ExtendedField**
 - **ExtendedFieldElement**

1.1.1 †FiniteField – finite field, abstract

Abstract class for finite fields. Do not use the class directly, but use the subclasses **FinitePrimeField** or **ExtendedField**.

The class is a subclass of **Field**.

1.1.2 †FiniteFieldElement – element in finite field, abstract

Abstract class for finite field elements. Do not use the class directly, but use the subclasses **FinitePrimeFieldElement** or **ExtendedFieldElement**.

The class is a subclass of **FieldElement**.

1.1.3 FinitePrimeField – finite prime field

Finite prime field is also known as \mathbb{F}_p or $\text{GF}(p)$. It has prime number cardinality.

The class is a subclass of **FiniteField**.

Initialize (Constructor)

FinitePrimeField(characteristic: *integer*) \rightarrow *FinitePrimeField*

Create a FinitePrimeField instance with the given characteristic. characteristic must be positive prime integer.

Attributes

zero :

It expresses the additive unit 0. (read only)

one :

It expresses the multiplicative unit 1. (read only)

Operations

operator	explanation
F==G	equality test.
x in F	membership test.
card(F)	Cardinality of the field.

Methods

1.1.3.1 createElement – create element of finite prime field

`createElement(self, seed: integer) → FinitePrimeFieldElement`

Create **FinitePrimeFieldElement** with seed.
seed must be int or long.

1.1.3.2 getCharacteristic – get characteristic

`getCharacteristic(self) → integer`

Return the characteristic of the field.

1.1.3.3 issubring – subring test

`issubring(self, other: Ring) → bool`

Report whether another ring contains the field as subring.

1.1.3.4 issuperring – superring test

`issuperring(self, other: Ring) → bool`

Report whether the field is a superring of another ring.
Since the field is a prime field, it can be a superring of itself only.

1.1.4 FinitePrimeFieldElement – element of finite prime field

The class provides elements of finite prime fields.

It is a subclass of **FiniteFieldElement** and **IntegerResidueClass**.

Initialize (Constructor)

FinitePrimeFieldElement(representative: *integer*, modulus: *integer*)
→ *FinitePrimeFieldElement*

Create element in finite prime field of modulus with residue representative. modulus must be positive prime integer.

Operations

operator	explanation
a+b	addition.
a-b	subtraction.
a*b	multiplication.
a**n, pow(a, n)	power.
-a	negation.
+a	make a copy.
a==b	equality test.
a!=b	inequality test.
repr(a)	return representation string.
str(a)	return string.

Methods

1.1.4.1 getRing – get ring object

`getRing(self)` → *FinitePrimeField*

Return an instance of `FinitePrimeField` to which the element belongs.

1.1.4.2 order – order of multiplicative group

`order(self)` → *integer*

Find and return the order of the element in the multiplicative group of \mathbb{F}_p .

1.1.5 ExtendedField – extended field of finite field

ExtendedField is a class for finite field, whose cardinality $q = p^n$ with a prime p and $n > 1$. It is usually called \mathbb{F}_q or $\text{GF}(q)$.

The class is a subclass of **FiniteField**.

Initialize (Constructor)

ExtendedField(basefield: *FiniteField*, modulus: *FiniteFieldPolynomial*)
→ *ExtendedField*

Create a field extension $\text{basefield}[X]/(\text{modulus}(X))$.

FinitePrimeField instance with the given characteristic. The modulus has to be an irreducible polynomial with coefficients in the basefield.

Attributes

zero :

It expresses the additive unit 0. (read only)

one :

It expresses the multiplicative unit 1. (read only)

Operations

operator	explanation
F==G	equality or not.
x in F	membership test.
card(F)	Cardinality of the field.
repr(F)	representation string.
str(F)	string.

Methods

1.1.5.1 createElement – create element of extended field

`createElement(self, seed: extended element seed) → ExtendedFieldElement`

Create an element of the field from seed. The result is an instance of **ExtendedFieldElement**.

The seed can be:

- a **FinitePrimeFieldPolynomial**
- an integer, which will be expanded in `card(basefield)` and interpreted as a polynomial.
- basefield element.
- a list of basefield elements interpreted as a polynomial coefficient.

1.1.5.2 getCharacteristic – get characteristic

`getCharacteristic(self) → integer`

Return the characteristic of the field.

1.1.5.3 issubring – subring test

`issubring(self, other: Ring) → bool`

Report whether another ring contains the field as subring.

1.1.5.4 issuperring – superring test

`issuperring(self, other: Ring) → bool`

Report whether the field is a superring of another ring.

1.1.5.5 primitive_element – generator of multiplicative group

`primitive_element(self) → ExtendedFieldElement`

Return a primitive element of the field, i.e., a generator of the multiplicative group.

1.1.6 ExtendedFieldElement – element of finite field

ExtendedFieldElement is a class for an element of F_q .

The class is a subclass of **FiniteFieldElement**.

Initialize (Constructor)

ExtendedFieldElement(representative: *FiniteFieldPolynomial*, field: *ExtendedField*)

→ *ExtendedFieldElement*

Create an element of the finite extended field.

The argument **representative** must be an **FiniteFieldPolynomial** has same basefield. Another argument **field** must be an instance of **ExtendedField**.

Operations

operator	explanation
a+b	addition.
a-b	subtraction.
a*b	multiplication.
a/b	inverse multiplication.
a**n, pow(a,n)	power.
-a	negation.
+a	make a copy.
a==b	equality test.
a!=b	inequality test.
repr(a)	return representation string.
str(a)	return string.

Methods

1.1.6.1 `getRing` – get ring object

`getRing(self)` → *FinitePrimeField*

Return an instance of `FinitePrimeField` to which the element belongs.

1.1.6.2 `inverse` – inverse element

`inverse(self)` → *ExtendedFieldElement*

Return the inverse element.
